Frequently Asked Questions **Glazing Options**

Our ethos is one of Quality, Service and Value... Guaranteed

At Turkington we utilise the most modern materials available. Our market leading glazing now usually incorporates a 90% Argon gas fill cavity, Low Emmisive Coating (LowE) and a warm edge spacer bar.

We can also offer glass options for:

- Improved acoustics. · Increased security.
- UV light reduction. Large sizes.

Glass

- · LowE heat reflective coating maximises solar gain and minimises heat loss. Maximises natural light without the haze and tint of cheaper options.
- 90% Argon Gas filled acts as a better buffer than dry air.
- Warm Edge Spacer Bar reduces heat loss around the edge of the glass units.

Frames

- Multi-chambered reinforced profiles for robust strength, security and heat performance.
- Co-extruded integral gaskets for air tight seal for life.
- Internally glazed.
- · Wide choice of colour, design options and finishes.

Heat

With Turkington windows cold spots are reduced, leaving the inner pane warmer and your home much more comfortable.

Additionally, our secure locking and 4-part fitting (Foam, Bolt, Seal and Trim) reduces draughts and noise so keeping your home safer and more comfortable.

Noise

Turkington glazing offers a range acoustic glass options.

Security

We have options of either Toughened or Laminated glass to make your some safer and more secure. Laminated glass offers increased security as it becomes progressively more difficult to break through the glass even when it has been broken.

U.V. Light

Laminated glass is manufactured by bonding together two or more layers of high-quality float glass under heat and pressure using an interlayer of polyvinyl butyral (PVB). The PVB has no adverse effect on light transmission but absorbs in excess of 99% of ultraviolet light. This helps reduce fabrics being bleached by the sun.

Weight

Opening sashes are limited to 40kg. This is normally more than adequate for most homes. We upgrade our hinges to a Mega 'Heavy Hinge' with easy clean and egress options when required.

Large Size

Glazed units can go up to 6m², depending on glass type chosen. This gives great flexibility on larger windows and doors.

turkingtonwindows.com

Condensation

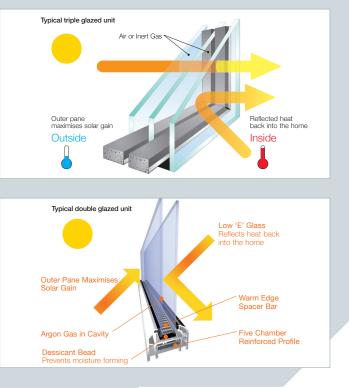

Due to the difference between external and internal temperatures, condensation may be formed on windows. Since modern glazed windows have additional air pockets, heat does not seep through at a fast pace so the internal temperature difference is significantly reduced. This helps to keep your internal pane clear and dry.

Not all glass units are the same

Did you know that our glass units routinely undergo the following tests:

- · Fragmentation: Safety from shards in laminate glass.
- Mechanical Strength: Make sure it meets wind and weight specifications.
- Roller Wave: Keep it flat and the glass is not 'Wavy'.
- Sealant: Ensure the glass and spacer bar bond is strong, for a long long unit life.
- · Desiccant: Lets the Argon work efficiently.
- Heat Soaking: Test toughened glass for purity. •

These routine tests ensure that you get the best performing glass in the market, which will serve you for years to come. Glass, it maybe clear, but it's not simple!
